Scheduling Seminar, July 7th, 2021  
<https://schedulingseminar.com>

# Outline of the Talk

- 1 Educational Timetabling: Problems & Benchmarks
- 2 Algorithms: Local Search
- 3 Experimental Results
- 4 Practical Issues
- 5 Discussion and Conclusions

# History of Timetabling

## Pioneering articles:

- [Gotlieb](#) (1963). The Construction of Class-Teacher Timetables.
- [Csima](#) (1965). Investigations on a Timetable Problem.
- [de Werra](#) (1971). Construction of School Timetables by Flow Methods.

## NP-completeness:

- [Even, Itai, & Shamir](#) (1976). On the Complexity of Timetabling and Multicommodity Flow Problems.

## Early surveys:

- [Schmidt & Strohlein](#) (1980). Timetable Construction — An Annotated Bibliography [200+ papers].
- [de Werra](#) (1985). An Introduction to Timetabling.
- [Schaerf](#) (1999). A Survey of Automated Timetabling.

# Current Activities

- PATAT conference series (<https://patatconference.org>):
  - ▶ established in 1995
  - ▶ the 13th edition will be in [Bruges in August 2022](#)
- International Timetabling Competitions:
  - ▶ First competition in 2002
  - ▶ Latest one (5th) in 2021
- PATAT EURO Working Group on Automated Timetabling (<https://patat.cs.kuleuven.be>)

# Educational Timetabling

“Assign teacher/student meetings to timeslots and rooms”

Main problems:

- High school timetabling
- University course timetabling
- University examination timetabling

Others:

- Event/Conference timetabling
- Student sectioning
- Balance academic curriculum

# Non-Educational Timetabling Problems

- **Employee Timetabling**: nurses, call centers, assembly lines, ...
- **Train Timetabling**: scheduling, platforming, ...
- **Sport Timetabling**: round robin tournaments, ...

# Motivations for Standards & Benchmarks in Timetabling

Early papers in timetabling:

- Define a brand-new problem
- Apply the authors' favorite technique
- Compare with the straw man:
  - ▶ Manual solution
  - ▶ Authors' naive implementation of an alternative technique

# Required Steps for Better Timetabling Research

- **Standard formulations:**
  - ▶ general vs. specific
  - ▶ simplified vs. realistic
- **Benchmark instances:** repositories, language, format, . . .
- **Reproducibility:** solution checker, execution checker
- **Statistical tests** for comparisons

# Standards & Benchmarks for Timetabling

## High School Timetabling:

- “Standard” formulation proposed in 2008
- By researcher from Netherlands, Australia, England, Finland, Brazil, Greece, Austria, and Italy
- Very general (and quite complex) formulation  
    “*No concession to judicious simplifications*”
- Uses an XML data format
- 40+ instances available at present
- Repository: <https://www.utwente.nl/ctit/hstt/>

# Standards & Benchmarks for Timetabling

## Examination Timetabling:

- Uncapacitated formulation [Carter *et al*, 1996]
  - ▶ 13 real-world benchmark instances: (No. of exams: 81 – 2419)
  - ▶ Still not solved to optimality
  - ▶ Extended by other researchers (by adding data)
- New complex formulation, with 12 instances [McCollum *et al*, 2007]
- Many others [Müller, 2016; Battistutta *et al*, 2020]

# Standards & Benchmarks for Timetabling

## Course Timetabling:

- **Post-Enrolment (PE-CTT)** [Paetcher, 2002]
  - ▶ many artificial instances available
- **Curriculum-Based (CB-CTT)** [Di Gaspero & Schaerf, 2002]
  - ▶ 50+ real-world instances from many universities
  - ▶ high-quality generator [Lopes & Smith-Miles, 2010]
- **Other formulations**
  - ▶ Rich, structured, and real-world [Müller *et al*, 2020]
  - ▶ ...

# International Timetabling Competitions (1/2)

## 1 ITC-2002

- ▶ Problem: PE-CTT
- ▶ Fixed deadline: 6 months for writing the solver
- ▶ Instances: 20 (10 Early + 10 Late), artificial
- ▶ CPU time limit ( $\approx$  10min)
- ▶ Final place-list based on average scores on soft constraints

## 2 ITC-2007

- ▶ Three tracks: Exams, PE-CTT (revised), CB-CTT
- ▶ More realistic formulations and real-world data
- ▶ Early, Late & Hidden instances
- ▶ Finalists' software re-run by organizers → No *Mongolian Horde!*
- ▶ Adjudication based on ranks on 10 runs per instance

# International Timetabling Competitions (2/2)

## ① ITC-2011

- ▶ On high-school timetabling
- ▶ Rules similar to ITC-2007
- ▶ A separate competition on best scores

## ② ITC-2019

- ▶ Complex structured problem: course timetabling + student sectioning
- ▶ Adjudication on best scores only (no timeout, no code)

## ③ ITC-2021

- ▶ Sport timetabling problem
- ▶ Same rules of ITC-2019

# Outline of the Talk

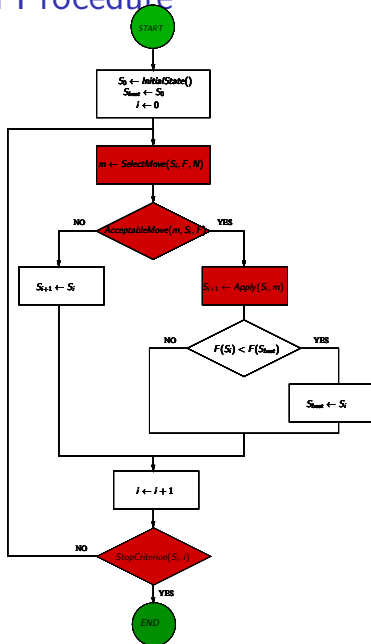

- 1 Educational Timetabling: Problems & Benchmarks
- 2 Algorithms: Local Search**
- 3 Experimental Results
- 4 Practical Issues
- 5 Discussion and Conclusions

# Local Search Procedure

stop criterion, the  $S_{i+1}$  iterations, stage selection, quality of state to be neighborhood analysis and move selection

initial state

# Simulated Annealing with Cut-off

```
procedure SimulatedAnnealing(SearchSpace  $S$ , Neighborhood  $\mathcal{N}$ ,  
CostFunction  $F$ , Parameters  $T_0, T_f, \alpha, N_s, N_a$ )  
   $T \leftarrow T_0$   
   $s \leftarrow \text{RandomState}(S)$   
   $s_{best} \leftarrow s$   
  while  $T \geq T_f$   
     $n_s \leftarrow 0$ ;  $n_a \leftarrow 0$   
    while  $n_s < N_s \wedge n_a < N_a$   
       $m \leftarrow \text{RandomMove}(s, \mathcal{N})$   
       $\Delta F \leftarrow F(s \oplus m) - F(s)$   
      if ( $\Delta F \leq 0$ )  
         $s \leftarrow s \oplus m$ ;  $n_a \leftarrow n_a + 1$   
        if ( $F(s) < F(s_{best})$ )  
           $s_{best} \leftarrow s$   
      else  
        if ( $\text{RandomReal}(0, 1) < e^{-\Delta F/T}$ )  
           $s \leftarrow s \oplus m$ ;  $n_a \leftarrow n_a + 1$   
       $n_s \leftarrow n_s + 1$   
     $T \leftarrow T \cdot \alpha$   
return  $s_{best}$ 
```

# Curriculum-Based Course Timetabling Problem

## Basic Entities:

- Courses & Lectures: **Databases** (3 times a week), ...
- Periods & Days: **Mon\_8:30-10:30**, ..., **Fri\_16:30-18:30**
- Rooms: **A** (312 seats), **N** (25 seats), ...
- Curricula:
  - ▶ **Civil Eng. (II year): Math2, Structural Eng., ...**
  - ▶ **Mechanical Eng. (III year): Math3, Metallurgy, ...**
- No student enrolment matrix

# Curriculum-Based Course Timetabling Problem:

## Cost Components:

- Conflicts (curriculum based) **Hard**
- Room Occupancy **Hard**
- Teacher Availability **Hard**
- Room Capacity **Soft**
- Minimum Working Days **Soft**
- Isolated Lectures **Soft**
- Room Stability **Soft**

“Simplifications a-go-go (not necessarily judicious!)”

# Solution by Local Search

Search space: [▶ Example](#)

Neighborhoods:

**MoveLecture:** Move one lecture to a new period and a new room

**SwapLectures:** Swap period and room of two lectures

Search method:

**Simulated Annealing**

# Simulated Annealing

**Sampling:** Draw a random move

**Acceptance rule:**

- if  $\Delta \leq 0$  always accept  $m$
- if  $\Delta > 0$  accept  $m$  with probability  $e^{-\Delta/T}$

**Cooling scheme:** after either  $N_s$  iterations or  $N_a$  accepted moves:

$$T := \alpha \cdot T$$

**Stop criterion:**  $T = T_f$

**Parameters:**

- Initial and final temperatures ( $T_0$  and  $T_f$ )
- Cooling rate ( $\alpha$ )
- Sampled moves per temperature ( $N_s$ )
- Accepted moves per temperature ( $N_a$ )
- Ratio: **MoveLecture/SwapLectures** ( $\rho$ )
- Weight of hard constraints ( $H$ )

# Outline

- 1 Educational Timetabling: Problems & Benchmarks
- 2 Algorithms: Local Search
- 3 Experimental Results**
- 4 Practical Issues
- 5 Discussion and Conclusions

# Parameter tuning

- **Fixed** number of iterations  $\mathcal{I}$ : compute  $N_s$  from the other parameters
- **Parameters**:  $T_0, T_f, \alpha, \sigma = N_a/N_s, \rho, w_H$
- **DoE**: Hammersley point set [Hammersley & Handscomb, 1964]
  - ▶ Example
- **F-Race** procedure [Birattari *et al*, 2010]
- **Friedman** rank-sum and **Wilcoxon** tests
- Software tool: **json2run** [Urli, 2013]

† Best contributions up to 2012

# Application to the Post-Enrolment Formulation

- Main difference:
  - Room assignment does not contribute to the objective function
- Preprocessing:
  - Identify Any-room events, which fit in any room
- Neighborhoods:
  - ▶ Select the period
  - ▶ Assign the room deterministically: to the “least attractive” one
- Comment: no matching

# Main Results for Post-Enrolment Course Timetabling

# Application to Uncapacitated Examination Timetabling

- Larger set of neighborhoods: Kempe chain, multi-swap, kick ...
- Principled [neighborhood portfolio](#) approach
- Large number of parameters: multi-stage tuning

# Comments on Results

- We use SA, a rather simple and “old-fashioned” technique (see [Franzin & Stützle, 2019])
- It outperforms many “modern” ideas (see [Sörensen, 2012])
- Complex neighborhood structures are needed
- A systematic, comprehensive, and statistically-principled tuning is crucial

# Outline of the Talk

- 1 Educational Timetabling: Problems & Benchmarks
- 2 Algorithms: Local Search
- 3 Experimental Results
- 4 Practical Issues**
- 5 Discussion and Conclusions

# Practical Timetabling at University of Udine

- **Course timetabling:** Many more objectives
  - ▶ Student's Workload
  - ▶ Double Lectures
  - ▶ Room Suitability
  - ▶ Preassignments
  - ▶ Lectures in external rooms
  - ▶ Consecutive days for teachers (commuters)
  - ▶ Lunch break
  - ▶ Max daily lectures for teacher
  - ▶ Simultaneity of courses
  - ▶ Fairness [Mühlenthaler, PhD, 2014]
  - ▶ ...
- **Examination timetabling:** "Italian" formulation [Battistutta et al, 2020]
  - ▶ No student enrolment (curriculum-based)
  - ▶ Multiple rooms for one exam
  - ▶ Teachers' preferences
  - ▶ Written and oral parts (in different days)

# Practical Considerations and Recommendations

- Considerations:

- ① Hard to keep apart combinatorial, psychological, political aspects
- ② Post-publication changes are very time-consuming
- ③ Users do not:
  - ★ feel the combinatorial complexity
  - ★ understand the objective function

- Recommendations:

- ① Convince teachers to specify requirements in advance!
- ② Limit preassignments as much as possible
- ③ The graphical interface is at least as important as the solver
- ④ Hide the objective function (do not search consensus upon it)

# Outline of the Talk

- 1 Educational Timetabling: Problems & Benchmarks
- 2 Algorithms: Local Search
- 3 Experimental Results
- 4 Practical Issues
- 5 Discussion and Conclusions**

# Future Trends in Timetabling (IMHO)

- 1 New requirements for COVID-19 emergency
- 2 Standard timetabling languages (JSON, XML), parsers, generators, ...
- 3 Benchmark repositories (and solution checkers)
- 4 Feature-based algorithm selection
- 5 Interactive rescheduling (“post-publication” tools)
- 6 Commercial software with state-of-the-art optimizers inside

Thank you!

# A search state
